

Road Accident Analysis Insights

Metric	Value	Share of Total
Total Casualties	453,051	100%
Fatal Severity	8,277	1.8%
Serious Severity	66,298	14.6%
Slight Severity	378,476	83.5%
Car Casualties	355,553	78.5%

Key Insights

1. **Severity:** Slight injuries form the largest share with **378,476 casualties (83.5%)**. Serious casualties are **66,298 (14.6%)**, while fatal casualties are **8,277 (1.8%)**.
2. **Vehicle type:** Cars account for **355,553 casualties (78.5%)**, making them the biggest contributor by a wide margin. Goods vehicles and bikes follow with **38,098** and **37,723** casualties.
3. **Road type:** Single carriageways record **334,988 casualties (73.9%)**, far more than dual carriageways at **73,416**. This makes single carriageways the main road-risk area in the dashboard.
4. **Road surface:** Most casualties occur on dry roads: **298,382 (65.9%)**. Wet roads account for **137,690 (30.4%)**.
5. **Urban vs rural:** Urban areas record **274,329 casualties (60.6%)**, compared with **178,709 (39.4%)** in rural areas.
6. **Light conditions:** Daylight accounts for **326,748 casualties (72.1%)**, while darkness accounts for **126,303 (27.9%)**.
7. **Monthly trend:** October has the highest casualty count at **41,138**, closely followed by November at **40,880**. February is the lowest month with **33,837** casualties.
8. **Year comparison:** Total casualties fell from **230,905** in 2020 to **222,146** in 2021, a decrease of **8,759 casualties (3.8%)**.

Recommendations

1. Focus road-safety campaigns on car drivers because cars contribute the largest share of casualties.
2. Give special attention to single carriageways through better speed control, road signs, lane marking, and enforcement.
3. Strengthen urban road-safety measures because urban areas have a higher casualty count than rural areas.
4. Plan extra safety checks and awareness efforts around October and November, when casualties are highest.
5. Do not focus only on bad weather. Most casualties happen on dry roads and in daylight, so everyday driving behaviour should remain the main prevention priority.

Final Conclusion

The analysis shows that road accident casualties are mainly concentrated in common driving conditions. Cars contribute **78.5%** of total casualties, single carriageways contribute **73.9%**, urban areas contribute **60.6%**, and daylight accounts for **72.1%**. The clearest action is to focus on high-volume everyday road use, especially car traffic, urban roads, and single carriageways. The decrease from 2020 to 2021 is positive, but the casualty level is still high and needs continued attention.
